Rehabilitation Guidelines For Tibial Plateau Fracture Open

Home - Canine Cruciate Registry

May 31, 2016 · In general, tibial plateau fractures are to be operated on, but the decision whether to operate or not on a specific fracture should be based on the fracture morphology, the soft tissues and the patient’s general condition, and the expected limb axis and articular surface restoration. Usual indications for surgical treatment are:

Motor accident permanent impairment guidelines - SIRA

One of the most common injuries to the knee of dogs is tearing of the cranial cruciate ligament (CCL). When the cranial cruciate ligament is torn, surgical stabilization of the knee joint is often required. A major advancement in the treatment of CCL rupture has been the development of tibial plateau leveling osteotomy or TPLO. Healing from TPLO surgery is generally rapid with ...

Post-operative rehabilitation typically lasts 6 to 9 months. The duration of each of the five phases and the total duration of the rehabilitation depends on the age and physical level of the patient, as well as the success of the operation. Also see page on PCL reconstruction. General Guidelines for the post-operative PCL rehabilitation:

Rehabilitation Guidelines for Knee Multi-Ligament Repair/Reconstruction The knee joint is comprised of an articulation of three bones: the femur the tibial plateau. The knee also is comprised of two menisci, which are fibro-cartilaginuous structures and each meniscus

**Expert Nailing System Titanium Cannulated Tibial Nail**

The traditional ECLS technique is the oldest surgical correction for cruciate ligament injury in dogs. The name of the procedure originates from the fact that the joint is stabilized outside the joint capsule (externally). CCL repair surgery typically consists of an initial examination of the inside of the knee. This examination may either be done by opening the joint capsule and ...

**Tibial Tuberosity Advancement (TTA) Surgery for Dogs**

A tibial tuberosity advancement (TTA) is used to treat a torn cranial cruciate ligament (CCL). Unlike other procedures, the goal of this surgery is not to recreate or repair the ligament itself, but rather change the dynamics of the knee so that the cranial cruciate ligament is no longer necessary for stabilizing the joint.

The meniscus are ‘C’ shaped discs, made of tough cartilage called fibrocartilage. They are positioned on the tibial plateau (top surface of the shin bone) between the tibia (shin bone) and the femur (thigh bone) and are important for distributing load and absorbing shock at the knee joint. There are two menisci within each knee joint.
